

What is new in Imaris 8: data manager, integrated batch processing and data mining

Imaris is a software for 3D and 4D microscopy image visualization and analysis.

The new Imaris 8 offers a fully integrated platform which allows the scientist to organise / explore the data, visualize it, analyse it, test hypothesis and present the results in the best possible manner.

During this workshop participants will learn to:

- Organise images into logical groups in the Arena (the new data manager tool).
- Design an image analysis protocol and apply it to a group of images (batch processing)
- Access the statistical results from the Batch analysis for data mining and comparison of results with Imaris plotting tools
